In the claims:

Please amend the claims such that the results are as follows:

1. (Currently amended) A method of operating a service control point, the method comprising:

receiving a call set-up message into the service control point for an incoming call; processing the call set-up message to identify a wireless-communication interface first device where the first device is a wireless device;

generating an alert message indicating the incoming call and caller information from the call set-up message;

transmitting the alert message from the service control point to the wireless communication interface first device;

receiving a response message into the service control point from the first device wherein the response message indicates a destination communication second device to receive the incoming call;

processing the response message to generate a routing instruction that connects the incoming call to the destination communication second device; and transmitting the routing instruction from the service control point.

- 2. (Canceled).
- 3. (Currently amended) The method of claim 2 wherein the wireless communication second device comprises a pager, a personal digital assistant, or a cellular phone.
- 4. (Original) The method of claim 1 wherein the call set-up message comprises a Transaction Capabilities Application Part query.
- 5. (Original) The method of claim 1 wherein the alert message comprises a called number, a dialed number, or a caller number.

- 6. (Original) The method of claim 1 further comprising determining whether the incoming call is to be intercepted for a called party.
- 7. (Original) The method of claim 1 further comprising generating a session for the incoming call with a session identifier.
- 8. (Currently amended) A software product for operating a service control point comprising:

service control point software operational when executed by a processor to direct the processor to receive a call set-up message for an incoming call, process the call set-up message to identify a first device where the first device is a wireless device wireless communication interface, generate an alert message indicating the incoming call and caller information from the call set-up message, transmit the alert message to the first device wireless communication interface, receive a response message from the first device wherein the response message indicates a second destination communication device to receive the incoming call, process the response message to generate a routing instruction that connects the incoming call to the second destination communication device, and transmit the routing instruction; and

a software storage medium operational to store the service control point software.

- 9. (Canceled).
- 10. (Currently amended) The software product of claim 9 wherein the <u>first wireless</u> communication device comprises a pager, a personal digital assistant, or a cellular phone.
- 11. (Original) The software product of claim 8 wherein the call set-up message comprises a Transaction Capabilities Application Part query.
- 12. (Original) The software product of claim 8 wherein the alert message comprises a called number, a dialed number, or a caller number.

- 13. (Original) The software product of claim 8 wherein the service control point software is operational when executed by the processor to direct the processor to determine whether the incoming call is to be intercepted for a called party.
- 14. (Original) The software product of claim 8 wherein the service control point software is operational when executed by the processor to direct the processor to generate a session for the incoming call with a session identifier.
- 15. (Currently amended) A communication system comprising: a service control point (SCP) comprising:

a processor configured to receive a call set-up message for an incoming call, process the call set-up message to identify a first device where the first device is a wireless device wireless communication interface, generate an alert message indicating the incoming call and caller information from the call set-up message, transmit the alert message to an SCP interface, receive a response message from the first device wherein the response message indicates a second destination communication device to receive the incoming call, process the response message to generate a routing instruction that connects the incoming call to the second a destination communication device, and transmit the routing instruction; and

the SCP interface connected to the processor and configured to transfer the call set-up message to the processor, transfer the alert message from the processor to the <u>first device wireless communication interface</u>, and transfer the routing instruction from the processor.

## 16. (Canceled).

 (Currently amended) The communication system of claim 16 wherein the <u>first device</u> wireless communication device comprises a pager, a personal digital assistant, or a cellular phone.

- 18. (Original) The communication system of claim 15 wherein the call set-up message comprises a Transaction Capabilities Application Part query.
- 19. (Original) The communication system of claim 15 wherein the alert message comprises a called number, a dialed number, or a caller number.
- 20. (Original) The communication system of claim 15 wherein the processor is configured to determine whether the incoming call is to be intercepted for a called party.
- 21. (Original) The communication system of claim 15 wherein the processor is configured to generate a session for the incoming call with a session identifier.
- 22. (Canceled).
- 23. (Currently amended) The communication system of claim 15 further comprising a switching system connected to the SCP and configured to process the routing instruction that connects the incoming call with the second device destination communication device.
- 24. (Currently amended) A method of operating a <u>first device where the first device is a wireless device wireless communication device</u>, the method comprising:

receiving an alert message indicating an incoming call and caller information from a service control point into the <u>first wireless communication</u> device;

processing the alert message;

determining a destination communication device for the incoming call should be sent to a second device;

generating a response message indicating a destination communication the second device is to receive the incoming call; and

transmitting the response message from the <u>first</u> wireless communication device to the service control point.

- 25. (Currently amended) The method of claim 24 wherein the <u>first wireless</u> emmunication device comprises a pager, a personal digital assistant, or a cellular phone.
- 26. (Original) The method of claim 24 wherein the alert message comprises a called number, a dialed number, or a caller number.
- 27. (Currently amended) A software product for a wireless communication device comprising:

wireless communication device software operational when executed by a processor to direct the processor to receive an alert message indicating an incoming call and caller information from a service control point, process the alert message, determine a destination communication device for the incoming call, where the destination communication device is different from the wireless communication device, generate a response message indicating a the destination communication device to receive the incoming call, and transmit the response message to the service control point; and

a software storage medium operational to store the wireless communication device software.

- 28. (Original) The software product of claim 27 wherein the wireless communication device comprises a pager, a personal digital assistant, or a cellular phone.
- 29. (Original) The software product of claim 27 wherein the alert message comprises a called number, a dialed number, or a caller number.
- 30. (Currently amended) A wireless communication device comprising:

a processor configured to receive an alert message indicating an incoming call and caller information from an interface, process the alert message, determine a destination communication device for the incoming call, where the destination communication device is different from the wireless communication device, generate a response message indicating a the destination communication device to receive the incoming call, and transmit the response message to the interface; and

the interface connected to the processor and configured to transfer the alert message from a service control point to the processor and transfer the response message from the processor to the service control point.

- 31. (Original) The wireless communication device of claim 30 wherein the wireless communication device comprises a pager, a personal digital assistant, or a cellular phone.
- 32. (Original) The wireless communication device of claim 30 wherein the alert message comprises a called number, a dialed number, or a caller number.
